

### **Amendments to the Claims**

This listing of claims will replace all prior versions, and listings, of claims in the present application:

### **Listing of Claims**

- 1) (Currently amended) A sterile transfer device for fluids comprised of a body having a bore formed through at least a portion of its interior, a movable plunger contained within the bore, wherein the body and the plunger are formed of plastic, the body having a first and a second end, the first end containing a face designed to be attached to the upstream component, the plunger having a corresponding first and second end, a port formed on the component selected from the group consisting of the second end of the plunger and downstream of the first end of the body, the port being connected to a downstream component, the first end of the plunger when in a closed position being in alignment with the face of the body, which combined, form a steamable surface and a sterile barrier against the environment to the rest of the interior of the body, the plunger and downstream components and a cam slot formed in the body, a cam formed on an outer surface of the plunger and contained within the cam slot and a handle formed on the plunger to move the plunger within the bore from a closed to an open and then back to a closed position.
- 2) (Original) The device of claim 1 wherein the bore is a central bore formed through the entire length of the body.
- 3) (Canceled)
- 4) (Original) The device of claim 1 wherein the device is formed of a plastic selected from the group consisting of polyetherimides(PEI), PEEK, PEK, polysulphones, polyarylsulphones, polyalkoxysulphones, polyethersulphones, polyphenyleneoxide, polyphenylenesulphide and blends thereof.
- 5) (Original) The device of claim 1 wherein the device is formed of polyetherimides(PEI).
- 6) (Canceled)
- 7) (Canceled)
- 8) (Canceled)

- 9) (Canceled)
- 10) (Canceled)
- 11) (Currently amended) A sterile transfer device for fluids comprised of a body having a bore formed through at least a portion of its interior, a movable plunger contained within the bore, the body having a first and a second end, the first end containing a face designed to be attached to the upstream component, the plunger having a corresponding first and second end, a port formed on the component selected from the group consisting of the second end of the plunger and the body downstream of the first end, the port being connected to a downstream component, the first end of the plunger when in a closed position being in alignment with the face of the body, which combined, form a steamable surface and a sterile barrier against the environment to the rest of the interior of the body, the plunger and downstream components and a cam slot formed in the body, a cam formed on an outer surface of the plunger and contained within the cam slot and a handle formed on the plunger to move the plunger within the bore from a closed to an open and then back to a closed position, wherein at least the first face of the body and the plunger are formed of a material selected from the group consisting of polyetherimides(PEI), PEEK, PEK, polysulphones, polyarylsulphones, polyalkoxysulphones, polyethersulphones, polyphenyleneoxide, polyphenylenesulphide and blends thereof.
- 12) (Canceled)
- 13) (Canceled)
- 14) (Previously presented) The device of claim 1 wherein the first face of the body is in the form of a sanitary flange.
- 15) (Previously presented) The device of claim 11 wherein the first face of the body is in the form of a sanitary flange.
- 16) (Currently amended) A sterile transfer device for fluids comprised of a body having a bore formed through at least a portion of its interior, the bore having a three sections each with a different diameter, the body having a first and a second end, the first end containing a face designed to be attached to the upstream component, a movable plunger contained within the bore, the plunger having a shape corresponding to that of the bore and being of a diameter less than that of the bore, the plunger having a corresponding first and second end, the second end of the plunger being

connected to a downstream component, the first end of the plunger when in a closed position being in alignment with the face of the body, which combined, form a steamable surface and a sterile barrier against the environment to the rest of the interior of the body, the plunger and downstream components, and a cam slot formed in the body, a cam formed on an outer surface of the plunger and contained within the cam slot and a handle formed on the plunger to move the plunger within the bore of the body.

- 17) (Previously presented) The device of claim 16 wherein the bore has a first bore section of a first set diameter, a second bore section of a set diameter greater than the first set diameter and a transition section between the first and second sections having a tapering diameter along its length from the first section to the second section which is a progression of the difference in diameters between the first set diameter and the second set diameter.
- 18) (Previously presented) The device of claim 16 wherein the bore has a first bore section of a first set diameter, a second bore section of a set diameter greater than the first set diameter and a transition section between the first and second sections having a tapering diameter along its length from the first section to the second section which is a progression of the difference in diameters between the first set diameter and the second set diameter and the progression is linear.
- 19) (Previously presented) The device of claim 16 wherein the plunger has one or more openings adjacent the first end and a fluid channel connecting the one or more openings to the second end of the plunger.
